NON RETURN & FLAP VALVES

INTRODUCTION

FLAP VALVES

The principle applications for flap valves are for surface water drainage associated with river, estuary and sea water outfalls to prevent backflow into the sewer and for final effluent outfalls from wastewater treatment works to prevent flood damage within the works.

NON-RETURN VALVES

Non return valves or backwater valves are used within sewerage and drainage systems to eliminate the risk of flood damage by the backflow of sewage or flood water into properties through low level entries such as low level drain gullies, toilets and washing machine outlets. The Environment Agency in their publication on damage limitation for properties at risk from flooding and the Government guidance note "Preparing for Floods" both recommend the installation of non-return valves (anti-flooding devices) on all such drains and sewers.

The Building Regulations 2000, Approved Document H, recommends the installation of non-return valves on drains from basements in low risk areas and on all drains in areas with a high risk of flooding or sewer surcharge.

These valves are also used in commercial and industrial application where non-pressure flow control is required (e.g. fish farming)

MATERIALS

FLAP VALVES

- Body & flap - Glass reinforced plastic using a isophthalic polyester resin with surface isophthalic gel coat
- Hinge - Self lubricating Ertacetal plastic
- Seal - Ethylene Propylene Diene Monomer (EPDM) to BS EN 681-1
Optional nitrile (NBR) seal available
- Fittings - Grade 1.4401 (316) austenitic stainless Steel to BS EN 10088-2

NON-RETURN VALVES

REDI (DN100 to 600)

- Body & Flap - PVCu
- Seal - Ethylene Propylene Diene Monomer (EPDM) to BS EN 681-1

Norham (DN250 to 500)

- Body & flap - Glass reinforced plastic using a isophthalic polyester resin with surface isophthalic gel coat
- Hinge - Self lubricating Ertacetal plastic
- Seal - Ethylene Propylene Diene Monomer (EPDM) to BS EN 681-1
Optional nitrile (NBR) seal available
- Fittings - Grade 1.4401 (316) austenitic stainless steel to BS EN 10088-2

NON – RETURN VALVES

REDI

DN100 to DN600

A range of PVCu non return valves complying with the requirements of BS EN 13564 - 'Anti-flooding devices for buildings'. Sizes DN100 to DN200 are certified by the German Institute LGA.

These valves are watertight to a pressure of 0.5 bar (5m Head).

These valves have a spigot and socket with integral seal as standard for direct connection to solid walled PVCu pipe but double spigot versions are available to special order for sizes DN400 and above. They can be connected to other pipe material using Mission Rubber Flexible couplings (see separate technical brochure).

DN100 - 200

DN250 - 300

DN400 - 600

Single Flap with Locking Lever

Nominal Size	D	L1	L2	L	H	REFERENCE

R = Stainless Steel Flap
D = Outside Diameter Spigot

NON – RETURN VALVES

Norham

DN250 to DN500

A range of grp non-return valves designed for connection to any pipe material using Mission Rubber Standard Couplings and Bushes.

ADVANTAGES

- Resistant to 1bar (10m head) back pressure
- Low weight for ease of installation yet with high mechanical strength
- Resistant to all normal sewage effluents operating at normal temperatures (below 80 C) and not containing harmful industrial effluents.
- Seals at a low level of back pressure
- Easily connected to any type of pipe material
- Low maintenance

DN250

DN300 - 500

Reference	DN	A	B	C	D	E	Wgt(kg)
MULTI250	250	485	455	730	260	60	14
MULTI300	300	490	470	825	320	35	23
MULTI400	400	605	590	995	410	35	26
MULTI500	500	700	710	1245	515	55	43

FLAP VALVES

A range of grp flap valves designed for ease of installation due to their low weight but with exceptional mechanical strength and durability.

ADVANTAGES

- Resistant to 1bar (10m head) back pressure (Multi-CD 0.8 bar)
- Most sizes can be handled by one person due to low weight
- Low weight ensures ease of installation
- High mechanical strength
- High resistance to corrosion and ultraviolet degradation
- Seals at a low level of back pressure
- Low operating head due to low weight
- Low maintenance

MULTI - N

DN200 to 600

A range of flap valves designed for direct connection to any type of drain or sewer pipe using Mission Rubber Standard Couplings and Bushes

ADVANTAGES

- Eliminates need for concrete headwall or pipe flange for fixing e.g. can be connected to the spigot of an outfall pipe passing through gabions
- No drilling required
- Fast and easy installation

Reference	A	B	C	D	E	F	Wgt(kg)

FLAP VALVES

MULTI – BD

DN100 to DN200

A range of small diameter flap valves with a PN 10 flange and an integral foamed EPDM rubber gasket for direct fixing to a flange or concrete headwall.

ADVANTAGES

- Lightweight for fast and easy installation
- No need for cement grout when fixing to a headwall

Reference	A	B	C	D	E	F	Wgt(kg)
MULTI100BD	212	220	57	110	55	185	0.5

MULTI200BD	372	340	65	200	75	315	1.5

Wall mounting kits available

MULTI – CD

DN250 to 600

A range of medium diameter flap valves with a PN 10 flange. Integral EPDM rubber sealing rings for sealing to concrete headwall.

ADVANTAGES

- Lightweight for fast and easy installation.
- Resistant to 0.8bar (8m head) backpressure.
- No need for cement grout when fixing to headwall.
- Hinged design ensures full face sealing when closed.

FLAP VALVES

MULTI – NB

DN200 to 1500

A range of medium diameter flap valves with an inclined flap and PN 10 flange. Integral EPDM rubber sealing rings for sealing to concrete headwall.

ADVANTAGES

- Lightweight for fast and easy installation.
- Inclined flap for additional security against backflow.
- No need for cement grout when fixing to headwall.
- Hinged design ensures flap closure when no discharge.

NOTE:

PCD = PITCH CIRCLE DIAMETER OF THE BOLT HOLES

Flanges drilled to BS EN 1092 PN10 pitch circle diameter as standard except those marked in red.

Standard bolt holes in the flanges are not drilled to BS EN 1092 diameters (see table) but can be supplied to special order.

GENERAL LOCATIONS

Flap valves should be fixed so as to avoid the accumulation of debris around the invert which could prevent the valve operating correctly.

TIDAL LOCATIONS

Turbulence of flow due to severe wave action will shorten the working life of a flap valve. Therefore it is recommended that careful consideration is given to the positioning of valves and they are installed within an outfall bay or otherwise protected from direct wave action by baffles.
